

PERI-IMPLANTITIS: DIAGNOSIS, PREVENTION, AND TREATMENT PROTOCOLS

A 2-Day Hands-On Program with Pig Mandibles

Dr. Daniele Cardaropoli

November 24 - 25, 2017

Dr. Cardaropoli received his Doctor in Dentistry and Certificate in Periodontology at the University of Torino, Italy. He is an International Member of the American Academy of Periodontology and Scientific Director of PROED - Institute for Professional Education in Dentistry and Director of the Oral Implantology Department at the "Sedes Sapientiae" Clinic in Torino.

Dr. Cardaropoli is the winner of the Goldman Award for the Clinical Research and of the National Award in Clinical Orthodontics. He is the Editorial Consultant for The International Journal of Periodontics and Restorative Dentistry, member of the Editorial Review Board of American Journal of Orthodontics & Dentofacial Orthopedics, member of the Editorial Advisory Board of The Journal of Implant & Advanced Clinical Dentistry, reviewer ad hoc for Journal of Periodontology and Journal of Clinical Periodontology.

He has lectured in Italy, Europe, US, Asia and Australia. Author of several articles published on peer-reviewed international journals, he has focused his interest on Periodontology, Implantology, Regenerative Therapy and Ortho-Perio Interdisciplinary treatment. Dr. Cardaropoli currently has a private practice in Torino, Italy.

Biological complications around osseointegrated implants are becoming more frequent. Peri-implantitis is an implant syndrome presenting progressive clinical attachment loss and progressive crestal bone recession. The primary etiology is associated with microbiological infection. A number of protocols have been suggested in the treatment of peri-implantitis. Nonsurgical procedures seem to be unsuccessful in resolving peri-implantitis lesions, while surgical procedures may create an access for treatment of the implant surface and correction of the bone defects by means of bone regenerative procedures. Unfortunately, no single surface treatment method (including chemical, mechanical or laser approach) seems to be effective in the decontamination of the implant surface. Moreover, the resolution of peri-implantitis following surgical treatment seems possible but the outcome of treatment should be influenced by the original implant surface characteristics and by the possibility of achieving complete defect debridement.

- Understand the criteria of peri-implant disease diagnosis
- Learn the indication of non-surgical / surgical therapy
- How to perform regenerative therapy for peri-implant defects
